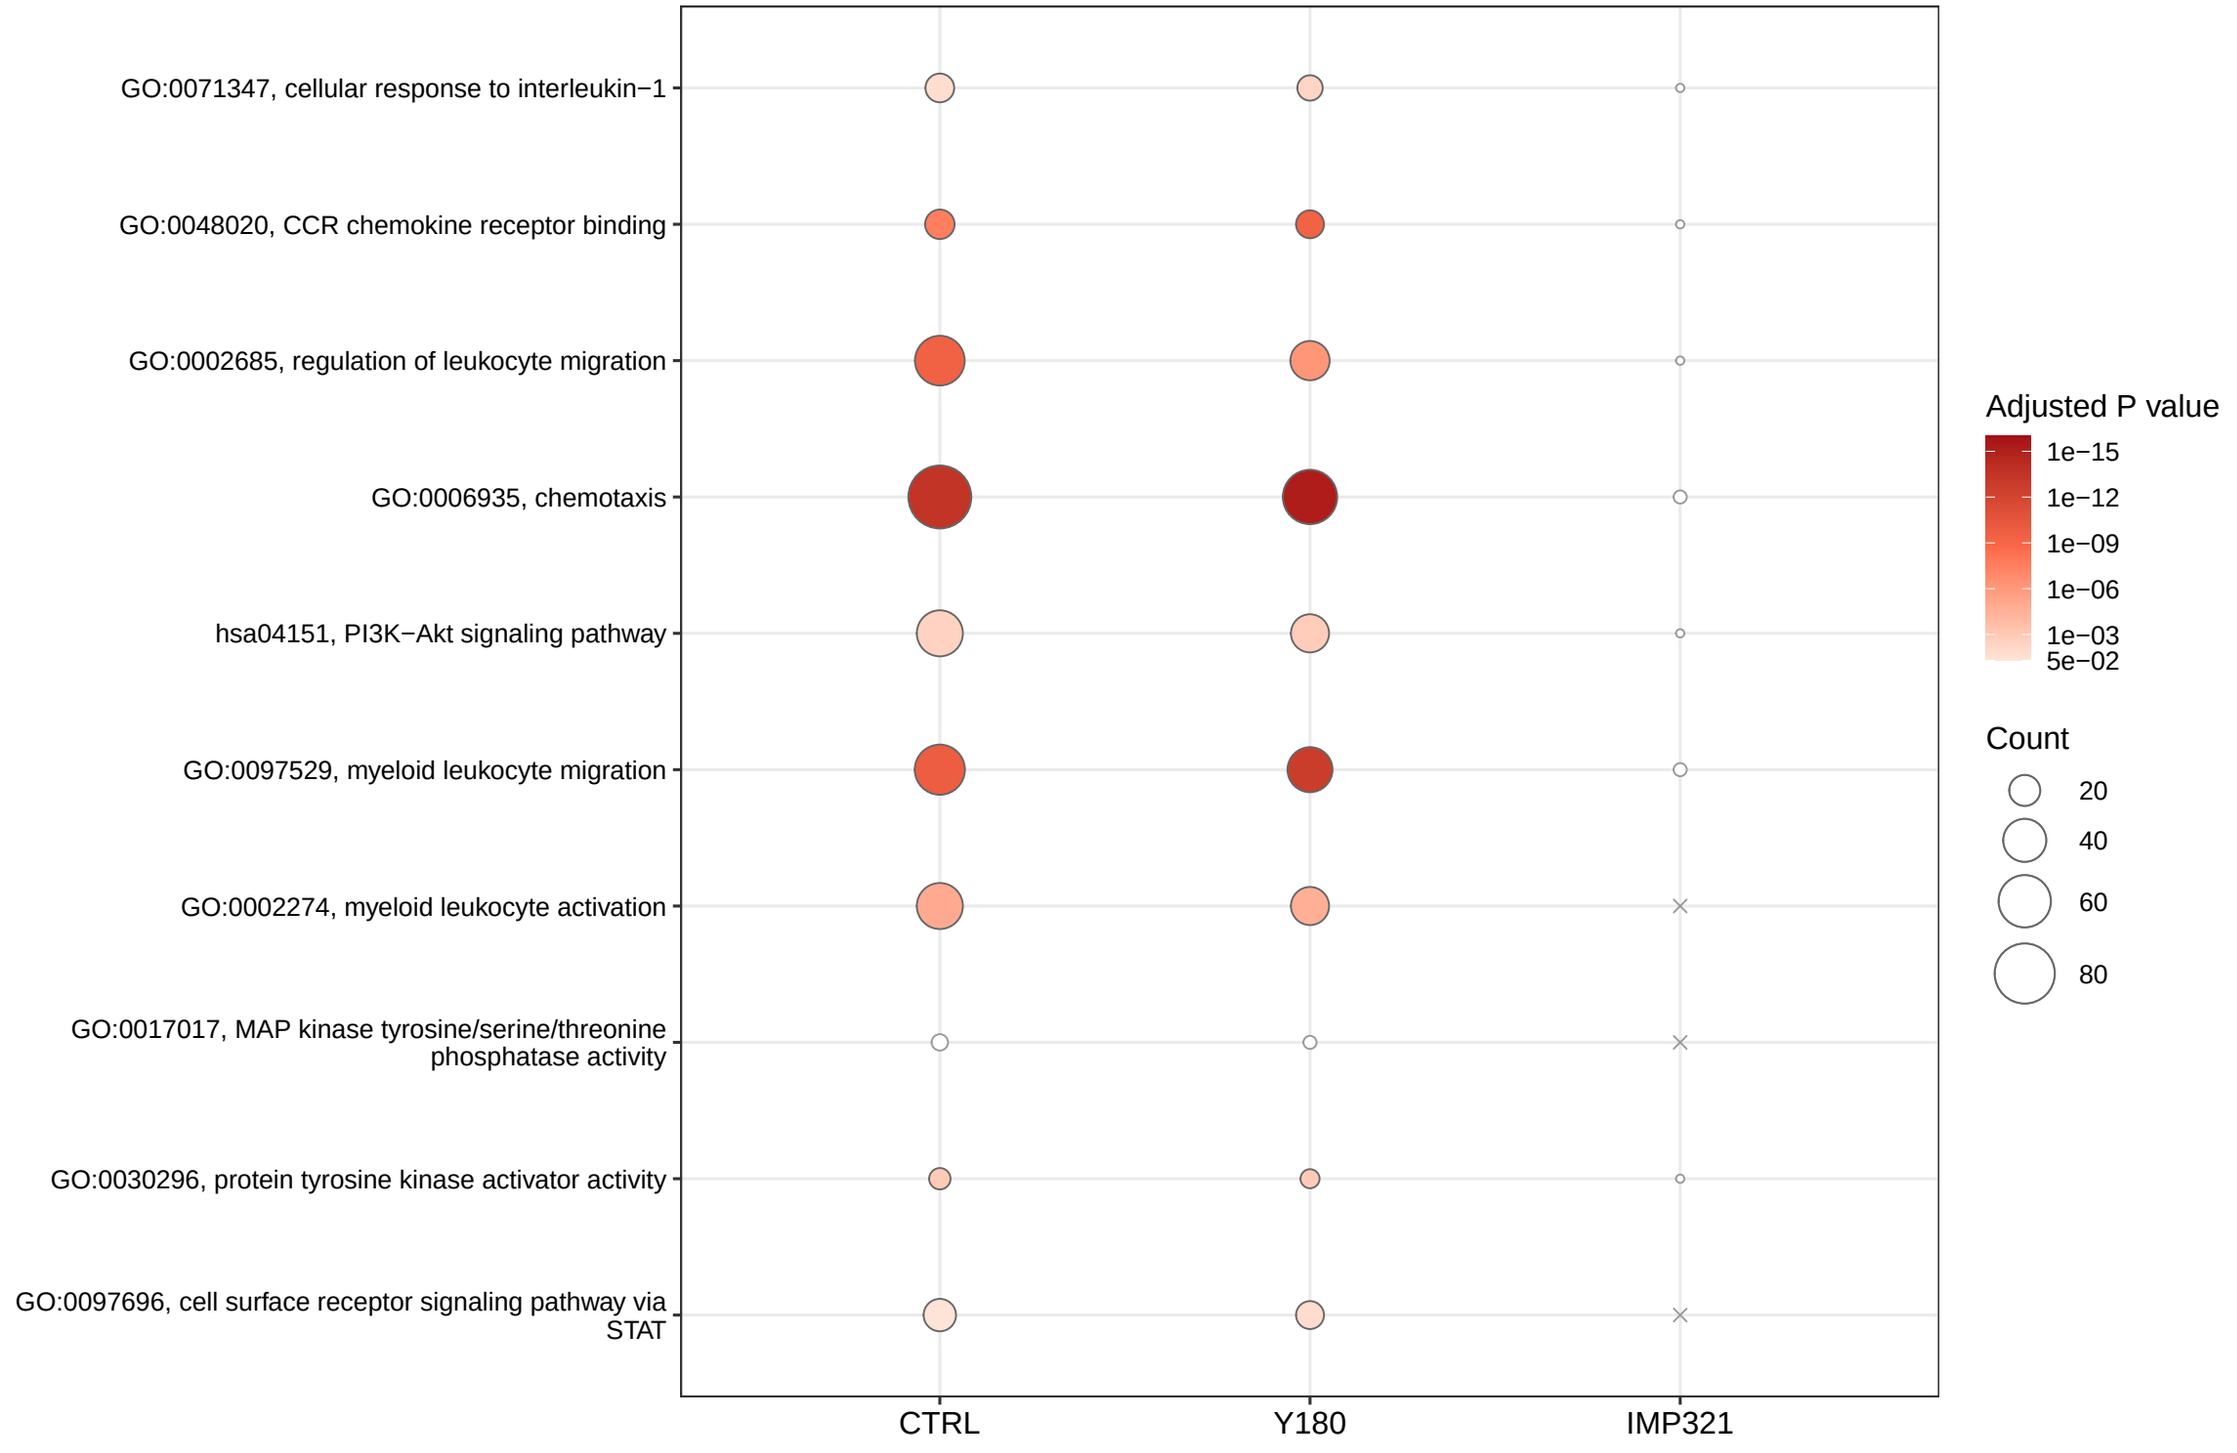
PBMC | Differential pathway enrichment

Each group vs the mean log expression of the other two; paired subject + group model



Count = pathway−overlapping DEGs, combining up− and downregulated genes; enrichment does not imply activation.
Filled = ORA BH−adjusted P < 0.05; hollow = not significant; x = zero overlapping DEGs.
DEG: gene−level BH P < 0.05 and |log2FC| >= 1. ORA BH correction covers all eligible sets and all three contrasts.
